2 Analysis

The impact sound levels generated by the standardized tapping machine are measured in the receiving room under a solid ceiling without and with a textile floor covering. From the measured values the reduction of impact sound pressure is calculated as follows:

ΔL = $L_{n,0}$ - L_n in dB

$L_{n,0}$ = Impact sound level without floor covering in dB

L_n = Impact sound level with floor covering in dB

To determine the weighted impact sound reduction the applicable reference curve is shifted in 1 dB steps into the mess curve so that the sum of the most unfavorable deviations correspondents as close as possible to the value of 32 dB without exceeding this value.

The linear impact sound level ΔL_{lin} of importance and you can calculate after the following equation:

$$\Delta L_{lin} = L_{n,r,0,w} + C_{I,r,0} - \left(L_{n,r,w} + C_{I,r}\right) = \Delta L_w + C_{I,\Delta}$$

$L_{n,r,w}$ the calculated weighted norm impact sound level of the cover blanket with the blanket edition to be checked is.
$L_{n,r,0,w}$ 78 dB, investigates$L_{n,r,0}$ to 4.3.1 DIN EN ISO 717-2 : 2013.
$C_{I,r}$ Spectrum customization value.
$C_{I,r,0}$ Spectrum customization value.

3 Test Results

3.1 Reference floor

Weighted standard impact sound level of the reference floor: $L_{n,0,w}$: 74 dB
$C_{I,0}$: -11 dB

3.2 Textile floor covering

ΔL_w = 21 dB **ΔL_{lin} = 9 dB**

$C_{I,\Delta}$ = -12 dB $C_{I,r}$ = 1 dB $C_{I,r,50\text{-}2500}$ = 2 dB

The results are based on tests, which were effected with on artifical source of sound under laboratory conditions. (standard procedure); compare measuring results in supplement 1 of this report.
